MNB musculus (strain:CS7BL/6J) adult male stomach CDNA to mRNA, clone_lib:RISM Full-length enriched mouse cDNA library close=2200002116.
cDNN Library Preparation: Life Technologies Inc.
MNL Library Arrayed by: The I M.A.G.E. Consortium (LLNL)
DNN Sequencing by: They'e Generica.

Note distribution: MGC close distribution information can be found through the IN.A.G.E. Consortium/LLNL at:
Plate: LLMNU316 row: g column: 22
High quality sequence stop: 535.

/incfe"Wector: pAMP1 (Gibco); Site 1: NoLf; Site 2: Sall; The library was constructed by Brandi Chiapelli and Dr. James McCarter at Mashington University, St. Louis. The CDNA was made by using Dynabeed oligo-dip Trining (Dynal). PERS based library using a modified protocol from the SMAT PR: CDNA SYRThesis RIX (from Clontech. Directionally cloned into the UDG sites of pAMP1. Nematodes were provided by Dr. Warwick Grant of AgRearch, New Zealand (Warrick, grantegeresearch. Co.nz).

Abackbone of the vector is basically from pBluescript (KS), that was in vivo excised from a modified 1PS phage vector (MO bi Tec, was in vivo excised from a modified 1PS phage vector (MO bi Tec, Germany). 5' and of the coronx that was digested with KNO1 was ligated to Sali site of the vector and the 3' end including polyatall was ligated to BamHI site of the vector. This full length omplified with conventional Ty and Ty pinhers. This full length of MA library was generated basically according to the method described in The Plant U 15, 707-720 (1988) Seki M: e. al.

Protonemants were blended by the POLYTRON, and then cultivated on the BCDATG medium for 13,-14 days under the continuous light.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BJ172818 LILI length cDNA library, chloronemata and young gametophores Physicomitrella patens subsp. patens cDNA clone BJ172818 LILI mRNA sequence. ds.cDNA molecules were generated as follows. Fitst-strand
cDNA was prepared from oligo-dT selected mRNA by priming
with a NoLI oligo-dT primer [5; related mRNA by priming
with a NoLI oligo-dT primer [5; related with RNABB H and used
as a template for DNA poll-catalyzed second strand
synthesis. After the addition of ECORI adaptors, the
ds-cDNAB were diseased with NoLI and size-selected. The
resulting molecules were directionally cloned into the
resulting molecules were directionally cloned
into the
resulting molecules were directionally cloned
into the second of the promable of the pyTTJPAC vector. The library
then went through one round of normalization to CoT value
of 5 based on the methods of Marcelo Bento Soares (Genome
Research 6: 791-606, 1996).

Libry parameters are set to seassament and vector trimming were
conducted using the Lucy software (Ahtrp://www.tigr.org/sofflab/).
Libry parameters were set to ensure an overall trimmed quality of
97.5 to Detter without any vector fragments in the chosen
physy. Detter without any vector fragments in the chosen the
phyyr and the high-quality region were replaced with N's b to serve
